
DISEASE:
Autosomal dominant spastic paraplegia type 4

NAME:	Autosomal dominant spastic paraplegia type 4
DESCRIPTION:	A rare form of hereditary spastic paraplegia with high intrafamilial clinical variability, characterized in most cases as a pure phenotype with an adult onset (mainly the 3rd to 5th decade of life, but that can present at any age) of progressive gait impairment due to bilateral lower-limb spasticity and weakness as well as very mild proximal weakness and urinary urgency. In some cases, a complex phenotype is also reported with additional manifestations including cognitive impairment, cerebellar ataxia, epilepsy and neuropathy. A faster disease progression is noted in patients with a later age of onset.
ORPHACODE:	100985
SYNONYMS:	SPG4
XREF(S):	Orphanet MeSH OMIM ICD-10
ANALYTE(S):	SPAST
CREATED:	13 May 2019 - 01:02
CHANGED:	22 Jun 2023 - 16:14
